This DNA encodes a human secreted protein. The specification provides secreted protein sequences (AAW63681 to AAW63699) encoded by the nucleic secreted protein sequences (AAW63681 to AAW43699) encoded by the nucleic acid sequences shown in AAV43601 to AAV43619. The invention provides a method of identifying a secreted polypeptide which is modified by rough microsomes. The secreted proteins can be used in assays to determine biological activities, such as cytokine, cell proliferation, or cellular differentiation activity, themototic or chemokinetic activity, haemostatic or thrombolytic activity, receptor/ligand activity, tumour inhibition, or thrombolytic activity, receptor/ligand activity, tumour inhibition, or anti-inflammatory activity. The proteins can also be used as biomarkers, to identify tissues or cell types which express the proteins, or a stage-or disease-specific alteration in protein expression. They can be used in protein interaction assays, to identify ligands or binding proteins. Compounds which affect the biological activities of the secreted proteins or their ability to interact with specific ligands can be identified using the proteins in screening assays. The proteins and antibodies that bind specifically to the protein can also be used to design diagnostic tests and therapeutic compositions for diseases which may be associated with altered expression of these proteins. Fusion proteins comprising, e.g. signal sequences or transmembrane domains of the proteins can be used to target other protein domains to cellular membrane or they can be secreted extracellularly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            230

The inhibitor, which was isolated from the human cancer cell line MKN45, can be used as an in vivo or in vitro regulatory factor for HGF or HGFA. It can also be used to raise antibodies, useful in kinetic studies of the inhibitor, or as assay standards

This invention describes a preventive and/or treating agent for the diseases caused by the exasperation of activity of protease of plasma kallikrein, plasmin, urokinase and trypsin. The agent contains a protein, HAI-1 which has the following properties, M.W. of ca. 40,000 to 57,000 Dalton by SDS-PAGE and an activity of inhibiting protease activity of hepatocyte growth factor (HGF) activator. The HGF inhibiting activity on the protein is specific. HAI-1 shows a high inhibiting activity on plasmin, trypsin, HGF activator and plasma kallikrein but substantially no inhibiting activity on thrombin. This sequence encodes the human HAI-1
                                                                                                                                                                                                                                                                                                                                                                 IleSerLysLysAspValPheGlyLeuArgArgGluIleProlleProSerThrGlySer

Human protease associated proteins are expressed in cancer and immortalised cell lines and tissues associated with inflammation and the immune response, and so appear to play a role in cell proliferative and immune disorders. The sequences can be used to diagnose, treat or prevent cell proliferative and immune disorders, including actinic keratosis, arteriosclerosis, atherosclerosis, bursitis, cirrhosis, hepatitis, mixed connective tissue disease, myelofibrosis, paroxysmal nocturnal haemoglobinuria, polycythaemia vera, psoriasis, primary

encoding novel human immunomodulator protein PRO256 (UNQ223) {see
AAB20113). The clone was isolated from a human placenta cDNA library. The
predicted protein (58 kDa, pg 6.22) shows homology to human bixunin,
indicating protease inhibitor activity. The invention provides
polynucleotides (see AAF30050-62) encoding novel human PRO proteins (see
AAB20108-20) including PRO256. Claimed compositions comprising their agonists are useful for increasing infiltration of for
inflammatory cells into a tissue of a mammal, stimulating or enhancing an
immune response in a mammal, or increasing the proliferation of T-
inflammatory cells into a tissue of an antigen. Claimed compositions
comprising the PRO polypeqide or its antagonist have the opposite
comprising the PRO polypeqide or its antagonist have the opposite
a T cell disorder, involves administering the PRO polypeptide, an agonist
a T cell disorder, involves administering the PRO polypeptide, an approach an antagonist antibody. The disorder is selected from
systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis,
clopathic inflammatory myopathy, Sjogren's syndrome, systemic
thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal
chisease, demyelinated diseases (such as multiple solerosis), autoimmune
chronic active hepatitis, inflammatory biliary cirrhosis, granulomatous
chepatitis, sclerosing cholangitis, inflammatory bowel disease (ulcerative
      rheumatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1516
colitis and Crohn's disease), gluten-sensitive enteropathy, Whipple's disease, (auto)immune-mediated skin diseases (such as bullous skin disease, erythema multiforme and psoriasis), allergic diseases (such as asthma, allergic rhinitis, atopic dermatitis, food hypersensitivity and urticaria), immunologic diseases of the lung and transplantation associated diseases (such as graft rejection and graft-versus-host disease) {all claimed}. Claimed methods of diagnosing these disorders comprise detecting the level of expression of the PRO gene. Also claimed are a method of identifying a compound capable of inhibiting the expression or activity of the PRO polypeptide, vectors, host cells, antibodies and a method of stimulating the proliferation of T-lymphocytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 100

"Human mature hepatocyte growth fact inhibitor, PRO256"

```
The present invention relates to PRO256 or its agonist/antagonist may be used to treat a cardiovascular, endothelial, or angiogenic disorder in a mammal, especially a human with cardiac hypertrophy, trauma, a type of tumour or age-related macular degeneration. PRO256 may be administered together with a cardiovascular, endothelial, or angiogenic agent, a chemotherapeutic agent, a growth inhibitory agent, or a cytotoxic agent. PRO256 may also be used to treat the disorders above, preferably through administration via ex vivo gene therapy. PRO256 or its agonist may be used to inhibit endothelial cell growth, angiogenesis or protease activity of a hepatocyte growth factor, whereas an antagonist of PRO256 may be used to stimulate endothelial cell growth, angiogenesis or protease activity of a hepatocyte growth factor. Stimulation of the protease activity of a hepatocyte growth factor is proferably carried out where a mammal has a cardiovascular, endothelial, or angiogenic disorder selected from peripheral vascular disease, hepatic or renal injury or a restinosis disorder. The present sequence is human hepatocyte growth factor inhibitor, PRO256 cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     endothelial,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          100
                                                                                                                                                                                                                                                                                     useful for
                                                                                                                                                                                                                                                                  The present invention relates to the isolation of novel human PRO polypeptides and the polynucleotide sequences encoding them. The PRO polypeptides, agonists, antagonists or anti-PRO antibodies are useful for treating benign or malignant tumours (e.g. renal, kidney, bladder, breast, etc), leukaemias and lymphoid malignancies, other disorders such as neuronal, glial, astrocytal, hypothalamic, glandular, macrophagal, stromal and blastocoelic disorders, inflammatory, immune and angiogenic disorders. The polynucleotide sequences are also useful in gene therapy. ABK40254-ABK40288 encode for the human PRO polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        80

                                                                                                                                                                                                                                                            ઠે
                                                                                                                                                                                                                                                                                                                  ABL88072 to ABL88258 encode the PRO proteins given in ABB84817 to
ABB85003. The PRO proteins and polynucleotides have cardiant, cytostatic,
antiangiogenic, hypotensive, vulnerary and antiarteriosclerotic
activities, and can be used in gene therapy. The PRO polynucleotides,
cardiachypertrophs, and antagonists are useful for treating or diagnosing
a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g.
cardiac hypertrophy, trauma, cancer, age-related macular degeneration,
angiogenesis, hypertension, arterial restenssis, rheumatoid arthritis,
angiogenesis (such as breast carcinoma and liver carcinoma) and wound
healing. The PRO polynucleotides have applications in molecular biology,
including use as hybridisation probes, and in chromosome and gene
mapping. ABL88259 to ABL88267 represent primers and probes used in the
exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1276

This invention relates to the cDNA and protein sequences of novel secreted and transmembrane polypeptides PRO polypeptides. The invention also comprises a method for producing the proteins of the invention by recombinant means and antibodies specific for the protein of the invention. The antibody may be used for detecting the PRO proteins of thinvention and may be used to modify their activity. polynucleotides may be used to modify their activity. polynucleotides may be used as hybridisation probes for a CDNA library to isolate the full-length PRO cDNA or to isolate other cDNAs, to construct hybridisation probes for mapping the gene which encodes that PRO and for genetic analysis of individuals with genetic disorders, in assays to identify other proteins or molecules involved in binding reaction, to generate transgenic animals or knock-out animals which in turn are useful in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   development and screening of therapeutically useful reagents, for chromosome identification, and tissue typing. The PRO polypeptides cuseful in gene therapy, and as molecular weight markers for protein electrophoresis purposes. The sequences may also be used to detect overexpression on PRO polypeptides in cancerous tumours and for screfor differentially expressed genes using microarray technology. The present sequence represents a cDNA encoding a human PRO protein of t

                                                                                                                                                                                                                                                                                                                                                                                                   of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                             tumour
                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides the protein and coding sequences of hum PRO proteins. These are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder, including cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthrit angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The present sequence is a coding sequence of the invention

invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, cervical and liver tumours). The colon, breast, prostate, rectal, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also antisense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for inducing endothelial cell tube formation and for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. This sequence represents a human PRO polymucleotide of the invention.

```
The invention relates to an isolated secreted/transmembrane (PRO)

polypeptide, having at least 80% sequence identity to a sequence selected
from any one of the 57 amino acid sequences given in specification, or to
a sequence encoded by a nucleic acid molecule selected from any one of
the nucleic acids deposited under any of the ATCC accession numbers given
in specification, or a sequence having at least 80% identity to PRO
can be a sequence acids of signal peptide. Also included are vectors,
transformed host cells, anti-PRO antibodise, the nucleic acids encoding
with or without its associated Signal peptide. Also included are vectors,
transformed host cells, anti-PRO antibodise, the nucleic acids encoding
with or without its associated Signal peptide. Also included are vectors,
transformed host cells, anti-PRO antibodise, the nucleic acids encoding
with or without its associated Signal peptide. Also included are vectors,
transformed host cells, anti-PRO antibodise, the nucleic acids encoding
administering PRO281, PRO2830, PRO2834 polypeptide or its agonist)
an oligonuclectide probe derived from any one of the above nucleotide
sequences. PRO6018 polypeptide is useful for stimulating the
proliferation or differentiation of fondrovyte cells, PRO313, PRO2030
and PRO2138 polypeptides are useful for stimulating the proliferation of
microvascular endothelial cells. PRO6071, PRO4487 and PRO606
colon, breast, prostate, rectal, kidney and liver. PRO281, PRO1560,
PRO189, PRO4499, PRO6308, PRO6000, PRO1075, PRO21207, PRO2033 and
PRO34274 polypeptides are useful for inhibiting the preparation of a
medicament for treating a condition responsive to PRO polypeptide. The
oligonuclectide sequences, for measuring or detecting the equences, or measuring or detecting the equences, or measuring or detecting the equences, and sa antisense Probes are useful for isolating genomic and sequences are useful for detecting the equences and as antisense probes. PRO polypeptides are useful as therapeutic agents, e.g. vaccines. The

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNN-alpha) from human blood, a method for stimulating the factor-alpha (TNN-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. lung, colon, breast, prostate, rectal, kidney and liver tumours). The polynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the colypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells and for inducing endothelial cell the increase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CysTyrGlyAsnLysAsnAsnPheGluGluGluGlnGlnCysLeuGluSerCysArgGly

with or without its associated signal peptide. Also included are vectors, transformed host cells, anti-PRO antibodies, the nucleic acids encoding PRO, PRO fusion proteins, inducing endothalial cell tube formation (by administering PRO281, PRO1860, PRO4899, PRO6808, PRO68018, PRO61275, PRO21207, PRO21821 or PRO218274 polypeptide or its agonist) and can oligonucleotide probe derived from any one of the above nucleotide sequences. PRO61818 polypeptide is useful for stimulating the proliferation or differentiation of fondacocyte cells. PRO3131, PRO2183 polypeptides are useful for stimulating the proliferation of human microvascular endothalial cells. PRO6071, PRO6487 and PRO6006 and PRO2183 polypeptides are useful for inhibiting the proliferation of human microvascular endothalial cells. PRO 8019/peptides are useful for inhibiting the proliferation of human microvascular endothalial cells. PRO 8019/peptides are useful for inhibiting the prosession of luman microvascular endothalial cells. PRO 8019/peptides are useful for inducing endothalial cells tube formation. PRO or the antibody are useful in the preparation of a medicament for treating a condition responsive to PRO 8019/peptide. The oligonucleotide sequences, for measuring or detecting the expression of an associated gene, and as antisense probes. PRO 8019/peptides. PRO 9019/peptides. PRO 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1216

This CDS clone is a part of a collection of human full length
expression clones generated by BD Biosciences Clontech and the
Harvard Institute of Proteomics. Each CDS has been cloned in two
forms: with and without stop-codon (to allow fusion with C-terminal
tag). The CDS has been directionally cloned using BD In-Fusion(TM)
cloning system between the Sall and HindIII sites of the pDNR-DUAL
vector. Additional sequences in the clone: 'ACC' after Sall site
and before 'ATG' to provide Kozak consensus sequence; 'GG' after
last codon and before HindIII site to maintain reading frame.

This CDS clone is a part of a collection of human full length
expression clones generated by BD Biosciences Clontech and the
Harvard Institute of Proteomics. Each CDS has been cloned in two
forms: with and without stop-codon (to allow fusion with C-terminal
tag). The CDS has been directionally cloned using BD In-Fusion(TM)
cloning system between the Sall and HindIII sites of the
pDNR-DUAL vector. Additional sequences in the clone: 'ACC' after
Sall site and before 'ATG' to provide Kozak consensus sequence;
'GG' after last codon and before HindIII site to maintain reading
frame. Clone distribution: http://bioinfo.clontech.com/orfclones.

**Andres G., McCluskey R.T.;

**Cogan distribution in rate of two members of the low-density lipoprotein receptor gene family, gp330 and LRP/alpa 2MR, and the receptor-associated protein (RAP).";

**Complex Binds plasminogen, extracellular matrix components, plasminogen activator-plasminogen activator inhibitor type I complex, apolipoprotein B-enriched beta-VDDL, lipoprotein lipas lactoferrin, clusterin and calcium.

**Complex Binds plasminogen, extracellular matrix components, plasminogen activator-plasminogen activator inhibitor type I complex, apolipoprotein B-enriched beta-VDDL, lipoprotein lipas lactoferrin, aminoglycosides and polymyxin B.

-!- FUNCTION: Receptor-mediated uptake of polybasic drugs such as aprotinin, aminoglycosides and polymyxin B.

-!- SUBUNIT: Forms a multimeric complex together with a receptor-associated protein (RAP). Binds to ankyrin-repeat family A protein clasvage at the cell surface.

-!- SUBCELLULAR LOCATION: Type I membrane protein. Expressed in clarkrin-coated pits; a soluble form is possibly derived by cleavage at the cell surface.

-!- TISSUE SPECIFICITY: Epithelial cells of kidney glomerulus and proximal tubule, lung, epididymis, yolk sac, among others.

-!- SIMILARITY: Contains 37 LDL-receptor class A domains.

-!- SIMILARITY: Contains 17 EGF like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ω
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         as

Complete assignment of disulfide bonds in bovine dopamin hydroxylase.";
Biochemistry 33:11563-11575(1994).
-!- FUNCTION: Conversion of dopamine to noradrenaline.
-!- CATALYTIC ACTIVITY: 3,4-dihydroxyphenethylamine + asc.
-!- CATALYTIC ACTIVITY: 3,4-dihydroxyphenethylamine + asc.
-!- COPACTOR: PQQ, copper and ascorbate + H(2)0.
-!- COPACTOR: PQQ, copper and ascorbate.
-!- SUBUNIT: Homotetramer.
-!- SUBUNIT: Homotetramer.
-!- SUBCELLULAR LOCATION: Exists both in a soluble form granules) and as membrane bound (the membrane bound anchored by an uncleaved signal peptide).
-!- SIMILARITY: Belongs to the copper type II, ascorbatemonoxygenase family.
-!- SIMILARITY: Contains 1 DOMON domain.
                                                                                                                                                                                                                                                                                                                                                                                                a soluble form membrane bound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This

Aya K., Tanaka H., Seino Y.;

Aya K., Tanaka H., Seino Y.;

"Novel mutation in the nephrin gene of a Japanese patient with congenital nephrotic syndrome of the Finnish type.";

Kidney Int. 57:401-404(2000).

-!- FUNCTION: Seems to play a role in the development or function of the kidney glomerular filtration barrier. May anchor the podocyte slit diaphragm to the actin cytoskeleton.

-!- SUBUNIT: Interacts with podocin/NPHS2. Interacts with CD2AP C-terminal domain (By similarity).

-!- SUBCELLULAR LOCATION: Type I membrane protein (Potential).

Predominantly located at podocyte slit diaphragm between podocyte foot processes. Also associated with podocyte apical plasma membrane.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2), AND SUBCELLULAR LOCATION

                                         congenital nephrotic [MIM:256300]; an by massive proteinuria
                                                                                                                                                                                                                            iona on
podocytes of the periphery of mature and developing glomeruli.

-!- PTM: Phosphorylated on tyrosine residues.
-!- DISEASE: Defects in NPHS1 are the cause of congenital nephrotic syndrome of the Finnish type (NPHS1 or CNF) [MIM:256300]; an autosomal recessive disorder characterized by massive proteinur in utero and nephrosis at birth.
-!- SIMILARITY: Belongs to the immunoglobulin superfamily.
-!- SIMILARITY: Contains 1 fibronectin type III domain.
-!- SIMILARITY: Contains 8 immunoglobulin-like domains.
-!- SIMILARITY: Contains 9 immunoglobulin-like domains.
-!- SIMILARITY: Contains 8 immunoglobulin-like domains.
-!- SIMILARITY: Contains 9 immunoglobulin-like domains.
-!- SIMILARITY: Selong 9 immunoglobulin-like domains.
-!- SIMILARITY: Selong 9 immu

MEDLINE=96312852; PubMed=8701988;

A Kocher O., Cheresh P., Lee S.W.;

"Identification and partial characterization of a novel membrane-
"I associated protein (MAPI7) up-regulated in human carcinomas and
"I modulating cell replication and tumor growth.";

L Am. J. Pathol. 149:493-500(1996).

-1- FUNCTION: May play an important role in tumor biology.

-1- FUNCTION: May play an important role in tumor biology.

-1- TISSUE SPECIFICITY: Expressed at significant levels only in a single epithelial cell population, the proximal tubular epithelial cells of the kidney. Diffusely expressed in various carcinomas originating from kidney, colon, lung and breast.

C. -!- FUNCTION: Necessary for host cell lysis. It is believed to conform endopeptidase that cleaves the amino-carboxyl cross-line for an endopeptidase that cleaves the amino-carboxyl cross-line murein component of the bacterial cell wall (By similarity).

C. -!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY UB. STRONG, TO LAMBDO PHAGES ENDOPEPTIDASES.

Isold=043570-2; Sequence=VSP_000772;
Note=No experimental confirmation available;
Note=No experimental confirmation available;
INTESTINE AND ACTIVATED LYMPHOCYTES. EXPRESSED AT MUCH HIGHER
LEVELS IN THE RENAL CELL CANCERS THAN IN SURROUNDING NORMAL KIDNEY
TISSUE. MODERATELY EXPRESSED IN PANCREAS, OVARY, AND TESTIS.
SIMILARITY: Belongs to the eukaryotic-type carbonic anhydrase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ij

"Crystal structure of the dimeric extracellular domain of human
carbonic anhydrase XII, a bitopic membrane protein overexpressed in
certain cancer tumor cells.";
Proc. Natl. Acad. Sci. U.S.A. 98:9545-9550(2001).
-!- FUNCTION: Reversible hydration of carbon dioxide.
-!- CATALYTIC ACTIVITY: H(2)CO(3) = CO(2) + H(2)O.
-!- COPACTOR: Zinc (By similarity).
-!- ENZYME REGULATION: Inhibited by acetazolamide.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- ALTERNATIVE PRODUCTS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 것
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EMBL; AF051882; AAC39789.1; -...
